There are two things a good electrician should always have handy, his wrench and this book. This book has all the information on all the lighting instruments that I have come across. When drawing or hanging my plot I make sure I have my book handy. No more guessing or looking for the torn instrument specs. This is the one great book an electrician can't do without.

I have read a lot of reviews (for other books) from people who bought books for the wrong reason. Make sure you understand- this is a specifications manual for professional stage electricians and lighting designers. This is not an introductory text book and is not appropriate for most amateurs and volunteers in community theatres. If you don't already know the meaning of the following words and phrases: throw distance, wattage, color temperature, bayonet, focal point, ERS, and Parabolic reflector...this is not your book. Even if you do- chances are, if you're not sure whether you need it, you probably don't. That being said- Every lighting designer and stage electrician should own this

book and keep it in their glove box with their wrench and gloves.

I bought this back in 2011 and I still use it all the time. It's an absolute must have for any lighting designer or electrician. There are a few things missing (instruments that can take lamps not listed, etc), but I'd still be lost without it. I have photometric apps on my phone, but I still much prefer this book.

I choose this rating because I haven't really needed it yet for work, but I believe it will come in handy more in the future. I like this product because I bought it for class and it did its job and will be useful in my future. I would recommend this product to those interested in the technical aspect of theatre.
